Social mobility among Canadians: A comparative study of intergenerational social mobility factors by parents' Canadian status

Amina Ayesha Quraishi

Department of Sociology and Anthropology, Concordia University

Introduction

Unique to Canada, numbers of children born to either 2 foreign-born parents or only one foreign-born parent have been on the rise. This trend will continue with a forecast of almost half of all children born in 2036 (Statistics Canada, 2017).

Previous studies on measuring the successful integration of these second generation Canadians has shown differences between them and their parents (Kasempipur & Halli, 2001; Goitom, 2012; Weldeyesus, 2009; Gebre, 2004; Matsuoka & Sorenson, 2001).

Limitations of these studies:

- Up to 17 years ago (not current)
- Contradictory results (parents are more socially mobile than their children and vice versa)
- Location of study not in Canada

Objective

To explore second generation Canadian's social mobility factors in relation to their parents. Factors include: Standard of Living, Educational & Employment Opportunities, Opportunities to acquire assets (houses, cars, etc.) & for leisure, and 5-year outlook on Life Opportunities.

Research Questions:

- 1. Are there any intergenerational differences in social mobility factors such as life opportunities among Canadians with one or 2 foreign-born parents, and with no foreign-born parent?
- 2. How do parental birth place, visible minority status, age, perceived social class and income affect social mobility among second generation Canadians?

Method

Using the General Social Survey, Cycle 30, 2016, raw data (PUMF) was extracted and analyzed via cross-tabulation and logistic regression models. This survey's theme was to provide a better understanding about the lifestyle behavior of Canadians that impact their health and well-being in the workplace and at home.

Income (from tax files for respondents 15+) \$50,769 \$29,831 \$37,500 \$25,000 \$125,000	Income (from toy files for many dents 15.)	\$50.760	¢20.921	\$27.500	¢25,000	\$125,000

Although most respondents were born without any foreign-born parent (65.7%) and were not visible minorities, a notable proportion of the sample can be considered second generation, with either 1 or both parents born outside Canada (34.3%) and were visible minorities (12.6%).

Respondents perceived their standard of living, opportunities to acquire assets like houses and cars, and general outlook on future life opportunities in the next 5 years as the same or worse than their parents (57.7%, 51%, 59.8%).

They reported perceptions of an improvement in their educational, employment and leisure opportunities from that which their parents had. (78.4%, 59.5%, 66.6%)

Their median income was reported at \$37,500, which coincides with their medium perceived social class (63.8% of respondents).

* Note: Income was removed, as it was used as a control variable.

Not a visible minority	99.1	94.9	53.5			

All variables are statistically significant except Perceived Social Class.

Most respondents with both parents born outside Canada perceived their social mobility differently than the other 2 groups: Standard of Living worse than their parents (63% vs 55.8% in other groups), whereas all other factors were perceived as better than their parents.

Respondents with either one or both parents born in Canada reported same or worse perceptions for opportunities to acquire assets and in their general 5 year life opportunity outlook.

Conclusions

The surprising result of lower expectations of improving one's Standard of Living among all respondents, and especially among those with immigrant parents may reflect Canada's modern economic reality. The result does seem to correlate with Kasemipur & Halli, despite 17 year-old data.

Another striking conclusion is that descendants of 2-immigrant parents exhibit more optimism than even their one-immigrant parent counterparts (expectations of improvements in most social mobility factors). This agrees with Goitom's research, where certain cultural traits are retained through transmission by both immigrant parents.

Lastly, the negative expectation among respondents with one or 2 Canadian-born parents to be unable to acquire assets like houses and cars also may indicate a shift in our modern economic milieu.

Second Generation respondents are roughly one and a half times more likely to perceive that their social mobility will improve more than their parents' except in Standard of Living, where they are 1.25 times more likely to perceive that their parents experienced better.

As social class increases, expectations for more opportunities to acquire assets, for leisure, and overall 5 year outlook also increases by approximately 1.5 times; however, the opposite direction holds true for Standard of Living.
